UI command

Makoto Asai (SLAC Computing Services)

Geant4 Tutorial Course @ Fermi Lab

October 27th, 2003

Geant4

Contents

- ▶ Alias and loop
- ▶ Mechanism of UI command
- ▶ Messenger class
- ▶ Defining a command
- ▶ Implementing a messenger

Alias

- ▶ Alias can be defined by
 - `/control/alias [name] [value]`
 - ▶ It is also set with `/control/loop` and `/control/foreach` commands
 - ▶ Aliased value is always treated as a string even if it contains only numbers.
- ▶ Alias is to be used with other UI command.
 - ▶ Use curly brackets, { and }.
 - ▶ For example, frequently used lengthy command can be shortened by aliasing.

```
/control/alias trv1 "/tracking/verbose 1"  
{trv1}
```

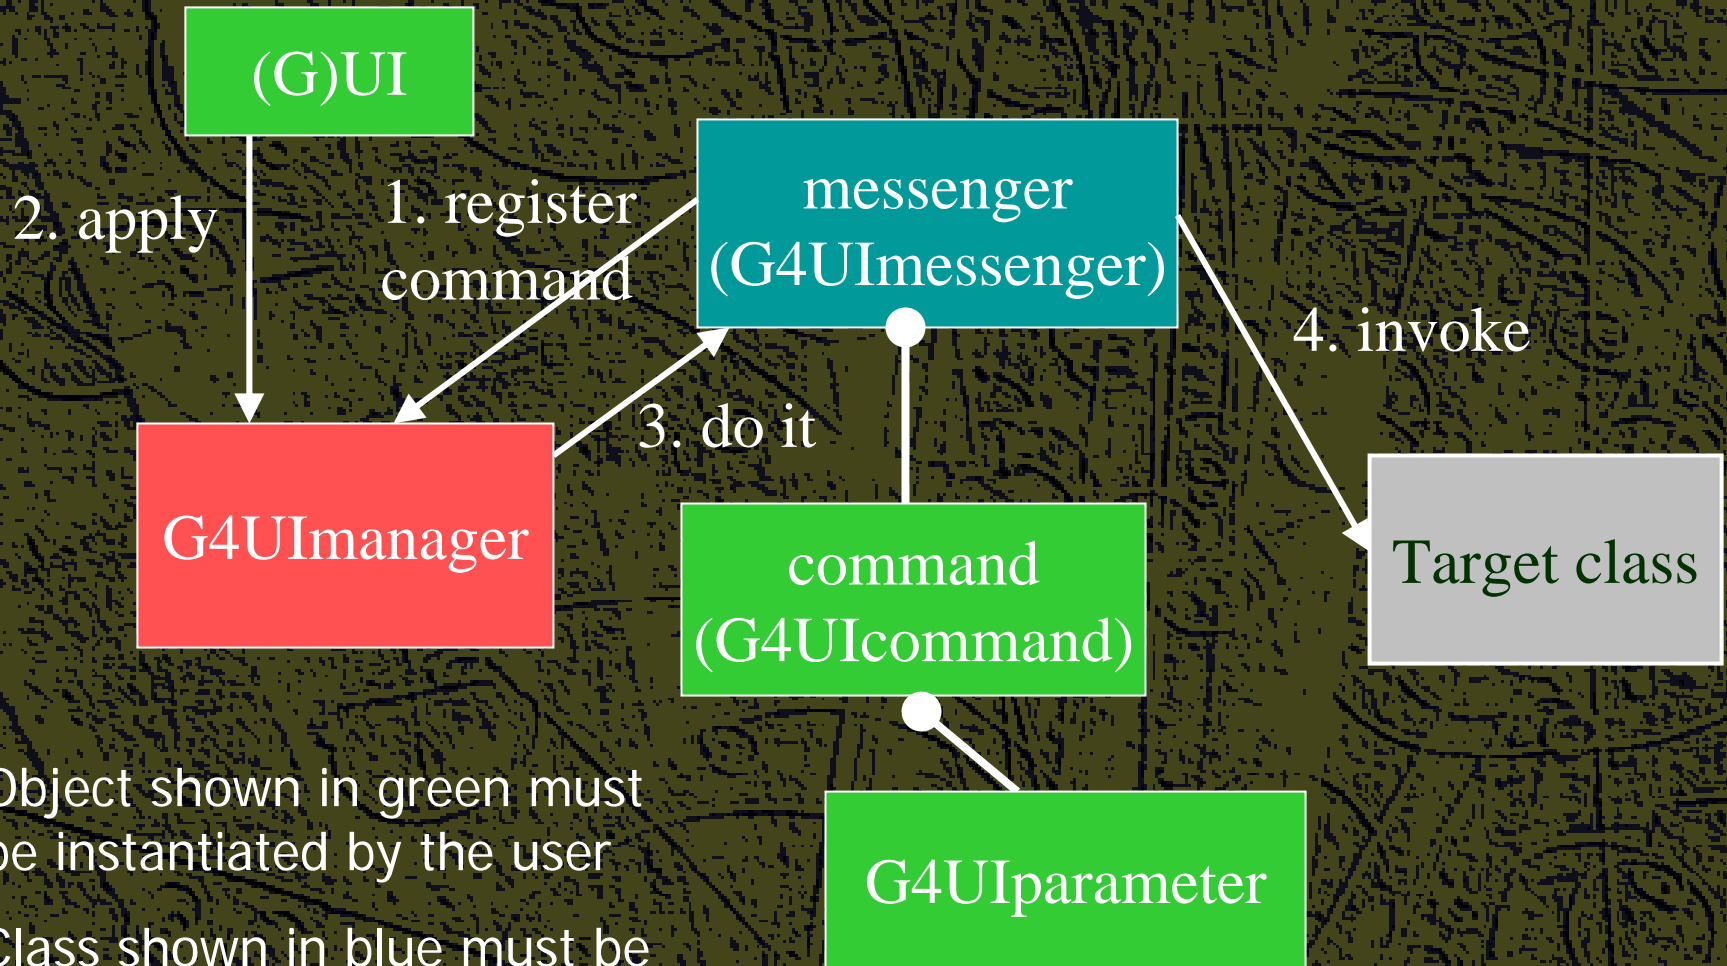

- ▶ Aliases can be used recursively.

```
/control/alias file1 /diskA/dirX/fileXX.dat  
/control/alias file2 /diskB/dirY/fileYY.dat  
/control/alias run 1  
/myCmd/getFile {file{run}}
```

Loop

- ▶ `/control/loop` and `/control/foreach` commands execute a macro file more than once. Aliased variable can be used inside the macro file.
- ▶ `/control/loop [macroFile] [counterName] [initialValue] [finalValue] [stepSize]`
 - ▶ `counterName` is aliased to the number as a loop counter
- ▶ `/control/foreach [macroFile] [counterName] [valueList]`
 - ▶ `counterName` is aliased to a value in `valueList`
 - ▶ `valueList` must be enclosed by double quotes (" ")
- ▶ on UI terminal or other macro file
`/control/loop myRun.mac Ekin 10. 20. 2.`
- ▶ in myRun.mac
`/gun/energy {Ekin} GeV`
`/run/beamOn 100`

Mechanism of UI command

Object shown in green must be instantiated by the user

Class shown in blue must be implemented and instantiated by the user

Messenger class

- ▶ Each messenger class must be derived from **G4UImessenger** base class. A messenger class can handle one or more UI commands.
- ▶ A messenger class **should be instantiated by** the constructor of the **target class** to which commands should be delivered, and **should be deleted** by the destructor of the target class.
- ▶ Methods of messenger class
 - ▶ **Constructor**
 - ▶ Define (instantiate) commands / command directories
 - ▶ **Destructor**
 - ▶ Delete commands / command directories
 - ▶ void **SetNewValue**(G4UIcommand* command, G4String newValue)
 - ▶ Convert "newValue" parameter string to appropriate value(s) and invoke a method of the target class
 - ▶ G4String **GetCurrentValue**(G4UIcommand* command)
 - ▶ Access to a get-method of the target class and convert the current values to a string

Definition (instantiation) of a command

- ▶ To be implemented in the constructor of a messenger class.

```
A01DetectorConstMessenger::A01DetectorConstMessenger
(A01DetectorConstruction* tgt)
:target(tgt)
{
    mydetDir = new G4UIDirectory("/mydet/");
    mydetDir->SetGuidance("A01 detector setup commands.");

    armCmd = new
        G4UICmdWithADoubleAndUnit("/mydet/armAngle",this);
    armCmd->SetGuidance("Rotation angle of the second arm.");
    armCmd->SetParameterName("angle",true);
    armCmd->SetRange("angle>=0. && angle<180.");
    armCmd->SetDefaultValue(30.);
    armCmd->SetDefaultUnit("deg");
}
```

- ▶ Guidance can (should) be more than one lines. The first line is utilized as a short description of the command.

G4UIcommand and its derivatives

- ▶ **G4UIcommand** is a class which represent a UI command. G4UIparameter represents a parameter.
- ▶ G4UIcommand can be directly used for a UI command. Geant4 provides its derivatives according to the types of associated parameters.
 - ▶ G4UIcmdWithoutParameter
 - ▶ G4UIcmdWithAString
 - ▶ G4UIcmdWithABool
 - ▶ G4UIcmdWithAnInteger
 - ▶ G4UIcmdWithADouble, G4UIcmdWithADoubleAndUnit
 - ▶ G4UIcmdWith3Vector, G4UIcmdWith3VectorAndUnit
 - ▶ **G4UIdirectory**
 - ▶ A UI command with other type of parameters must be defined by G4UIcommand base class.

Parameter name(s)

```
void SetParameterName(  
    const char*parName,  
    G4bool omittable,  
    G4bool currentAsDefault=false);
```

```
void SetParameterName(  
    const char*nam1, const char*nam2, const char*nam3,  
    G4bool omittable,  
    G4bool currentAsDefault=false);
```

- ▶ Parameter names are used in help, and also in the definition of parameter range.
- ▶ If "omittable" is true, the command can be issued without this particular parameter value.
- ▶ If "currentAsDefault" is true, current value of the parameter is used as a default value, otherwise default value must be defined with SetDefaultValue() method.

Range, unit and candidates

`void SetRange(const char* rangeString)`

- ▶ Available for a command with numeric-type parameters.
- ▶ Range of parameter(s) must be given in C++ syntax.
`aCmd->SetRange("x>0. && y>z && z>(x+y)");`
- ▶ Not only comparison with hard-coded number but also comparison between variables and simple calculation are available.
- ▶ Names of variables must be defined by SetParameterName() method.

`void SetDefaultUnit(const char* defUnit)`

- ▶ Available for a command which takes unit.
- ▶ Once the default unit is defined, no other unit of different dimension will be accepted.
- ▶ Alternatively, you can define a dimension (unit category) without setting a default unit.

`void SetUnitCategory(const char* unitCategory)`

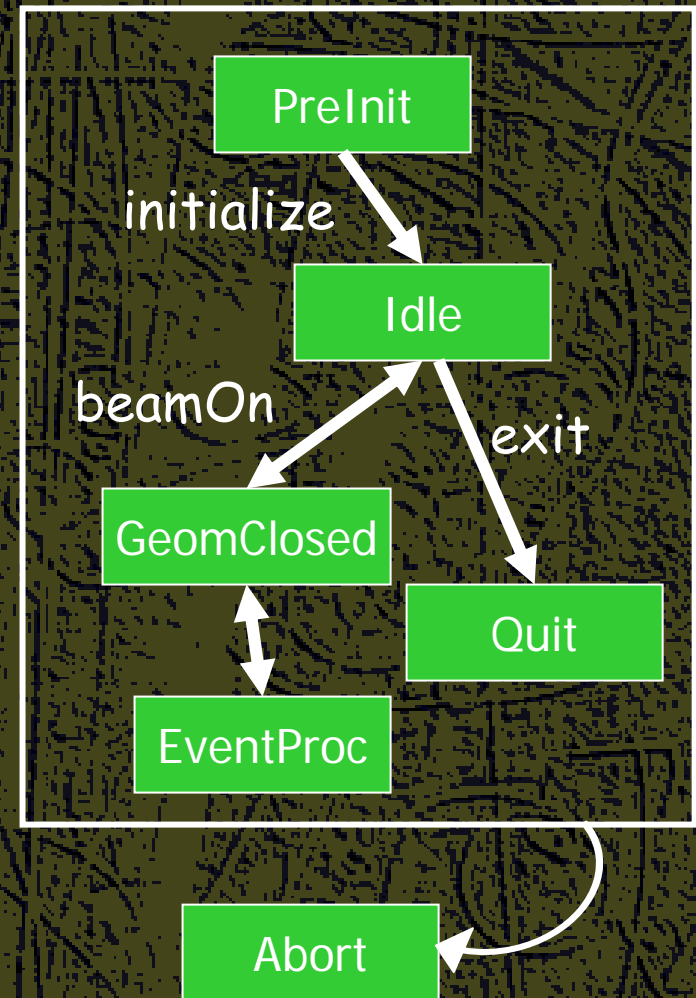

`void SetCandidates(const char* candidateList)`

- ▶ Available for a command with string type parameter
- ▶ Candidates must be delimited by a space.
- ▶ candidates can be dynamically updated.

Available state

`void AvailableForStates(G4ApplicationState s1,...)`

- ▶ Define command's applicability for Geant4 application states.
- ▶ Geant4 has six application states.
 - ▶ G4State_PreInit
 - ▶ Material, Geometry, Particle and/or Physics Process need to be initialized
 - ▶ G4State_Idle
 - ▶ Ready to start a run
 - ▶ G4State_GeomClosed
 - ▶ Geometry is optimized and ready to process an event
 - ▶ G4State_EventProc
 - ▶ An event is processing
 - ▶ G4State_Quit, G4State_Abort
 - ▶ UI command unavailable

Converting between string and values

- ▶ Derivatives of G4UIcommand with numeric and boolean parameters have corresponding conversion methods.

- ▶ From a string to value

```
G4bool GetNewBoolValue(const char*)
```

```
G4int GetNewIntValue(const char*)
```

```
G4double GetNewDoubleValue(const char*)
```

```
G4ThreeVector GetNew3VectorValue(const char*)
```

- ▶ To be used in **SetNewValue()** method in messenger.
- ▶ Unit is taken into account automatically.

- ▶ From value to string

```
G4String ConvertToString(...)
```

```
G4String ConvertToString(...,const char* unit)
```

- ▶ To be used in **GetCurrentValue()** method in messenger.

SetNewValue and GetCurrentValue

```
void A01DetectorConstMessenger
```

```
::SetNewValue(G4UIcommand* command,G4String newValue)
```

```
{  
    if( command==armCmd )  
    { target->SetArmAngle(armCmd->GetNewDoubleValue(newValue)); }  
}
```

```
G4String A01DetectorConstMessenger
```

```
::GetCurrentValue(G4UIcommand* command)
```

```
{  
    G4String cv;  
    if( command==armCmd )  
    { cv = armCmd->ConvertToString(target->GetArmAngle(),"deg"); }  
    return cv;  
}
```
